Chemistry Building Renovation

Construction Update - Week of November 29th, 2021

Demolition on Level 2 is almost wrapped up allowing for new framing to begin.

Helical screws** are in the ground Footings starting this week.

**Helical screws are a method for adding stability to footings that can't be as big or deep as traditional footings. (Huge screw that goes into the ground).

Visualize it: Make a fist and put it on your desk (that is a traditional footing, Big & Heavy). Now bend your fingers down and support your hand on your fingertips. (Your palm is the low-profile footing, and your fingers are the helical screws.)
Here is a view of level three showing demolition underway.

Meanwhile on level 1 walls are getting ready for paint.
